TECHNOLOGY

Solution:

EPC Gen2 compliant
vehicle tracking solution

Tag Type:

Parka™ UHF Passive

Reader/Antenna:

Xtenna™
Xtenna Proximity™

Method:

Multiple Tracking via Integrated
Reader/Antenna modules

Integration Platform:

RFID Middleware:

Xtenna™ WebToolkit
Xtenna™ Studio

Application: Essen RFID's
Car Access System

Database: SQL Server 2005 Exp. ed.

Tag Manufacturer/Supplier:

Essen RFID, with US based chip inlay

Reader/Antenna Manufacturer:

Essen RFID, with US based module

Systems Integrator:

Essen RFID

CASE STUDY

KEY REQUIREMENTS:

Lifestyle Apartment Services, a Portuguese run company in Bangalore is a luxury building complex for expatriates which provides the best services for luxurious living. These apartments are equipped with intelligent programmable logic devices that apply integrated technologies for communication, entertainment and energy management. In order to provide enhanced services to its clients, the company wished to extend this intelligent management to its car access systems for the apartments. It therefore required a system that would automate vehicle access control at the premises.

Main challenges in implementation:

- Identify and allow entry only to authorized vehicles.
- Indicate correct parking space without any waiting.
- Intelligently manage multiple parking spaces for vehicle owners.
- Automatically log each vehicle's entry and exit.

SOLUTION:

Essen RFID offered a Car Access System based on RFID, that was easy to operate, saved time and automated vehicle identification, tracking and parking management. The system deployed Xtenna™ antenna-readers at the entry/exit gates along with a boom barrier for vehicle access control and parking indicator lights.

IMPLEMENTATION:

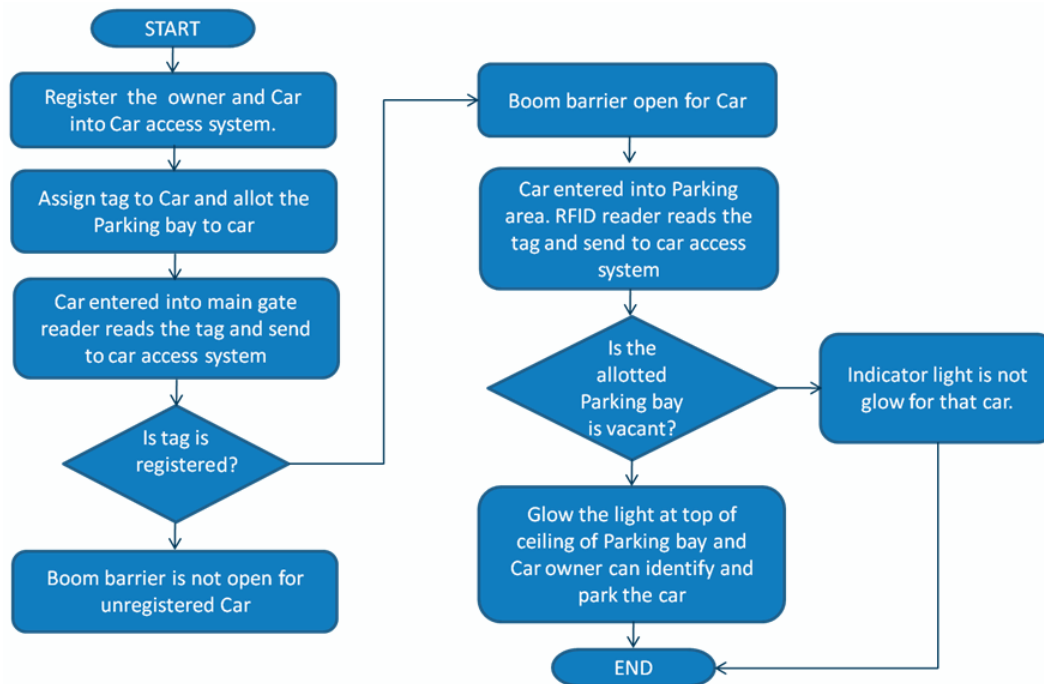

Two Xtenna™ RFID antenna-readers are installed at the IN (Main) gate and two more Xtenna™ RFID antenna-readers are installed at the OUT gate of the building premises. A boom barrier is set up at the IN gate. A single Xtenna™ antenna-reader is installed at the entrance of the parking area. Indicator lights are placed at the ceiling of each parking bay. A multiple port trigger switch is deployed for triggering the parking indicator lights.

A PARKA™ RFID tag is issued to each authorized vehicle and affixed to its windshield. Each tag is registered into the database for the respective vehicle, using a Xtenna Proximity™ reader. The system, developed through .NET technology, utilizes MS SQL Server as the database.

CASE STUDY

WORKING:

When a new vehicle owner requires a parking bay allocated to him within the premises, he registers the vehicle and owner's name into the Car Access System.

A PARKA™ RFID tag is registered using the Xtenna Proximity™ reader and assigned to the vehicle in the database. The tag is then affixed to the windshield of the car.

Xtenna™ antenna-readers are mounted at the IN and OUT gate for tracking and verification of vehicles. When a car enters the premises, the IN gate reader reads the tag and sends this information to the server, which checks if the tag has been registered. If the tag is registered into the system, then the boom barrier opens for the car and its entrance date and time are logged into the system. If the tag is not found to be registered, the system considers the car as not authorized and the boom barrier does not open.

On entering the premises, the car moves into the parking area. The Xtenna™ mounted there reads the vehicle's tag and sends the information to the server.

The server checks the vehicle owner's allotted parking bay and then checks if the bay is vacant. If any vacant parking bay is found, the system's multiport trigger switch triggers the indicator lights for that particular bay. The driver can now easily locate the exact parking bay for parking his vehicle.

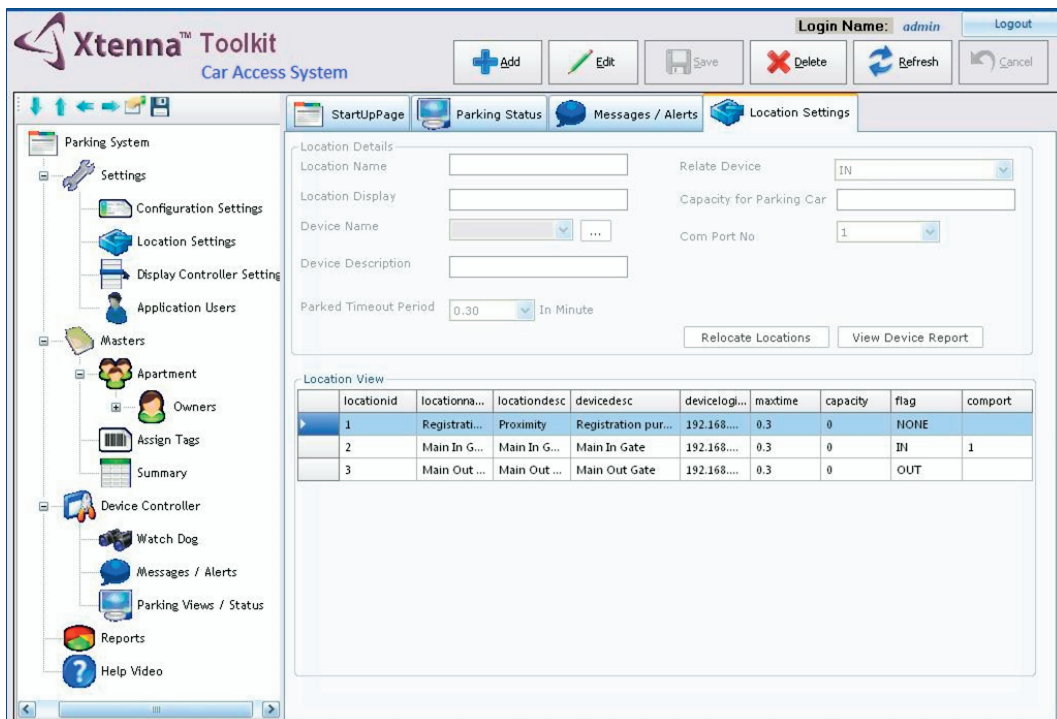

CASE STUDY

The various modules of the system are:

- Location Master
- Apartment Master
- Owners Master
- Vehicle Master
- Assign Tags
- Summary
- Parking Status

Location Master: This module assigns the device IP for a particular location along with the purpose of that location, i.e. whether the location is used for IN, OUT, Registration, etc.

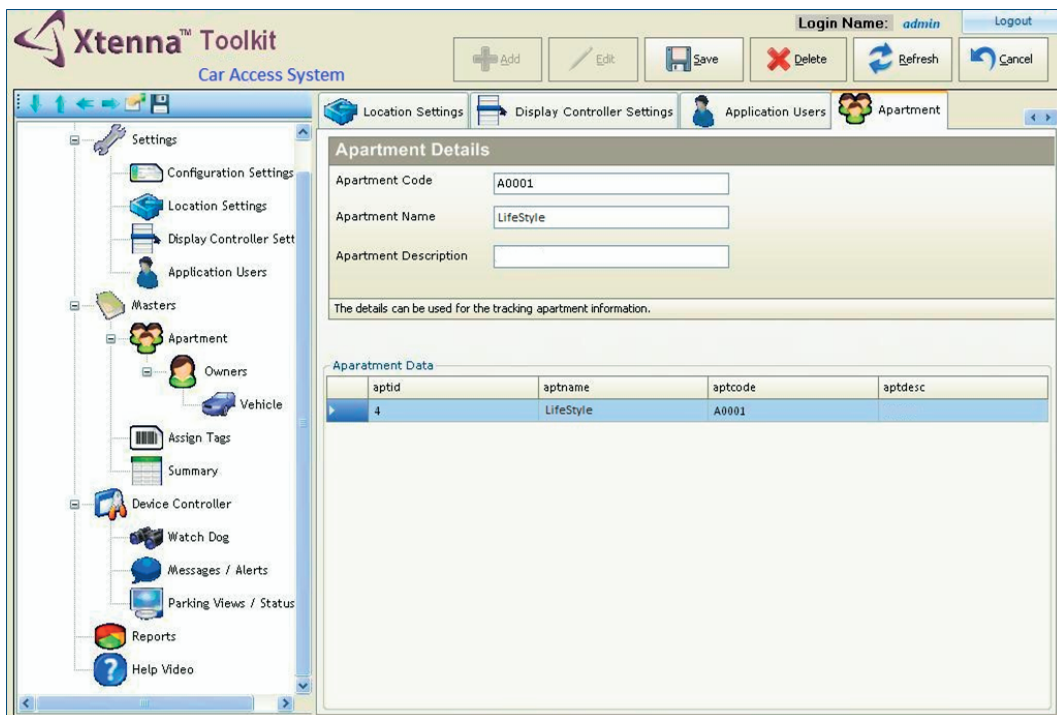

The screenshot displays the Xtenna Toolkit Car Access System interface. The left sidebar shows a tree view with categories: Parking System, Settings, Configuration Settings, Location Settings, Display Controller Setting, Application Users, Masters, Apartment, Owners, Assign Tags, Summary, Device Controller, Watch Dog, Messages / Alerts, Parking Views / Status, Reports, and Help Video. The main window is titled 'Location Settings' and contains a 'Location Details' section with fields for Location Name, Location Display, Device Name, Device Description, Relate Device (dropdown), Capacity for Parking Car, Com Port No (dropdown), and Parked Timeout Period (0.30 In Minute). Below this is a 'Location View' table showing a list of locations.

locationid	locationna...	locationdesc	devicedesc	devicelegi...	maxtime	capacity	flag	comport
1	Registrati...	Proximity	Registration pur...	192.168....	0.3	0	NONE	
2	Main In G...	Main In G...	Main In Gate	192.168....	0.3	0	IN	1
3	Main Out ...	Main Out ...	Main Out Gate	192.168....	0.3	0	OUT	

Apartment Master: This module enables the operator to register the apartments within the premises, including their details such as apartment code, name and description.

CASE STUDY

Vehicle Master: Here the operator registers the vehicle with its owner in the database. Vehicle details such as vehicle name, model, manufacturer, license plate number, vehicle photograph, etc. are also entered in this module.

The screenshot shows the 'Vehicle Master' module in the Xtenna Toolkit. The interface includes a sidebar with navigation options like 'Parking System', 'Settings', 'Masters', 'Apartment', 'Owners', 'Vehicle', 'Assign Tags', 'Summary', 'Device Controller', 'Reports', and 'Help Video'. The main area is titled 'Vehicle Details' and contains a form for entering vehicle information. The form includes fields for 'Vehicle Name' (Sam), 'Size' (small), 'Model' (BMW), 'Color' (BLACK), 'License Plate No.' (KA-3G-G2-5454), 'Make' (BMW), and 'Vehicle Type' (4-Wheeler). There is also a 'Browse Image' button and a 'Load Template' button. Below the form is a table titled 'Vehicle Data' showing a list of vehicles with columns for id, ownName, name, make, color, plate..., photo, carsize, model, tagid, ve, m, and ow.

id	ownName	name	make	color	plate...	photo	carsize	model	tagid	ve	m	ow
6	John	Ford	Ford	RED	KA-...	Photo	small	VXI	e2003412dc030...	4...	1...	1...
7	Kevin	Merc	Merc	BLACK	KA-...	Photo	small	VXI	e2003412dc030...	4...	2...	3...
8	Joseph	CRV	CRV	BLUE	KA-...	Photo	small	DTS	4...	4...	1...	1...
9	Sam	BMW	BMW	BLA...	KA-...	Photo	small	BMW	4...	2...	3...	3...

Assign Tag: This module is used to assign the PARKA™ RFID tag to the vehicle that has already been entered into the system. The tag is read by a Xtenna Proximity™ reader and the operator selects the vehicle's license plate number. Once the tag has been assigned to the vehicle, the parking bay is also allotted to the vehicle.

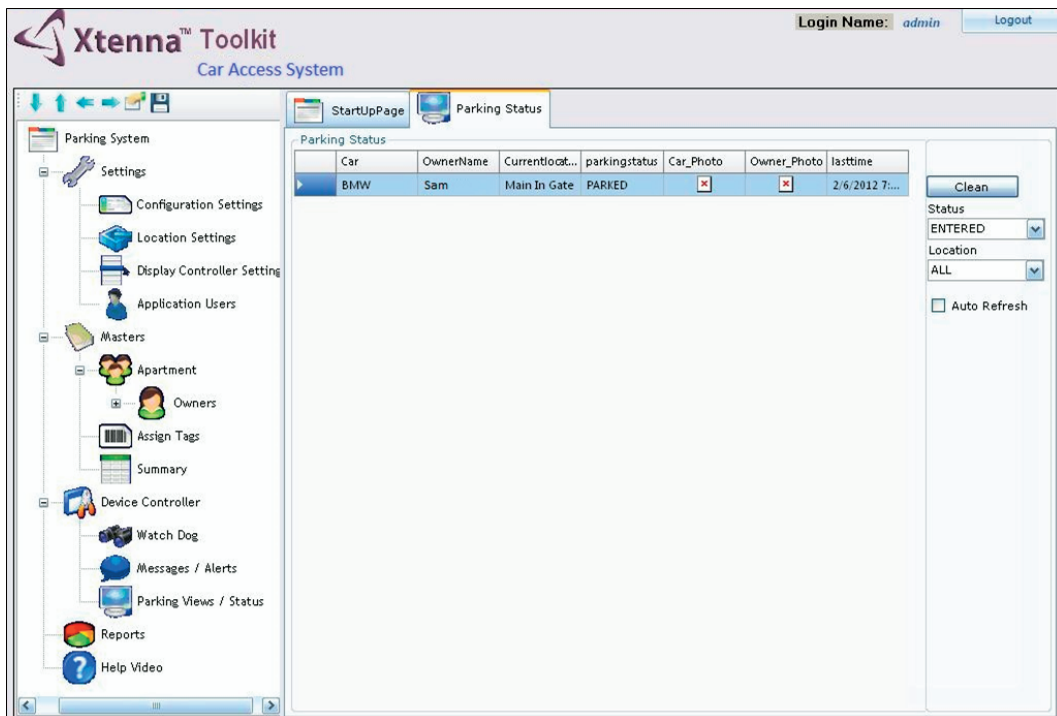

The screenshot shows the 'Assign Tag' module in the Xtenna Toolkit. The interface includes a sidebar with navigation options like 'Parking System', 'Settings', 'Masters', 'Apartment', 'Owners', 'Vehicle', 'Assign Tags', 'Summary', 'Device Controller', 'Reports', and 'Help Video'. The main area is titled 'Assign Tag' and contains a form for assigning a tag to a vehicle. The form includes fields for 'Device' (192168.123.45), 'Tag ID' (E2003412DC03011947055707), 'Detected Time' (2/9/2011 11:15 AM), and 'Plate No.' (KA-3G-G2-5454). There are also buttons for 'Detect Tag', 'Valid', 'Assign Tag', and 'Assign To Car'. On the right side, there are two small images: a person's photo and a car's photo, both with labels 'Sam' and 'BMW' respectively.

CASE STUDY

Summary: This module provides a summary owner-wise view of vehicles, along with the details of those vehicles.

Parking View/Status: Here the operator can view a list of all vehicles that have been parked in the parking area. This enables viewing of live parking status and location of the vehicles.

BENEFITS:

- Secure and automated functioning with RFID technology.
- Prevention of unauthorized vehicle entry into the premises.
- Reduction in time taken compared to manual identification of vehicles and opening of boom barrier.
- Automated logging of entry and exit at IN and OUT gates.
- Automatic detection of vehicle in the parking area and automated indicator light guidance for proper parking.
- Live status of vehicles in parking area.
- Saves time and brings ease of use through reduction in manual operations.
- Improved efficiency through automated processes.
- Features centralized report generation for the administrator.
